MC12 Assessment: Multiple-Choice Questions

GenAI Bootcamp · Week 6, MC12: Safety, Fairness & Transparency

Name:	Batch / Employee ID:	Date:

Instructions

15 questions, 1 mark each (total 15). Each question has exactly one correct answer. Choose the best option and record your answers on the separate answer sheet or in the space provided by your facilitator. No negative marking.

1. Which three pillars did this session cover?

A) Safety, fairness and transparency

2. What is "prompt injection"?

B) Text that a system reads, such as in a document, web page or message, that tries to override its instructions

3. An agent can send emails and make payments. Why does this raise the safety stakes compared with a plain chatbot?

C) A mistake can now cause real-world consequences, not just a wrong sentence

4. Which combination is the most appropriate set of guardrails for an agent that can make payments?

D) Limit what it can access, require human approval for high-impact actions, and keep monitoring it

5. In AI safety, what does "over-trust" mean?

A) People accept an output without checking it because it sounds sure

6. At which points can bias enter an AI system?

B) Data, goals and labels, design, and deployment

7. A model is not given a person's gender, but it uses a postcode input that closely tracks a sensitive trait. What does this illustrate?

C) A stand-in (proxy) input carrying bias through the design

8. A system reports high overall accuracy. What is the safest conclusion about its fairness?

D) It could still work worse for one group, so results should be checked group by group

9. Which three things make up transparency, as framed in this session?

A) Disclosure, explanation and records

10. Which statement best fits "transparent does not mean correct"?

B) A system can show clearly how it reached a wrong answer

11. Why should a language model's own explanation of its reasoning be treated with caution?

C) A fluent explanation is not necessarily a faithful account of how the answer was actually produced

12. In the live demo, two near-identical requests that differed only in a name gave slightly different answers. What is the right conclusion?

A) It is an anecdote, not evidence of bias; real testing needs many samples and careful design

13. The "black-box shortlist" dilemma was mainly a tension between which two things?

B) Speed and explainability

14. On the question of whether an agent should act without human approval, which view best reflects the session?

D) Match oversight to the cost and reversibility of a mistake: approve risky or irreversible steps, allow low-stakes ones

15. When an AI system makes a harmful decision, who is accountable?

C) A human or organisation that owns the outcome

End of questions.
